

Healthcare IT Assessment Checklist

NOT SURE WHERE TO START?

SimiTree's healthcare IT assessment checklist outlines the most important areas that you should look at when conducting a comprehensive analysis of your organization's technical environment:

Governance

Is there an IT governance team in place? Who makes IT decisions, and how do they make them?

Management & Staffing

How is your IT department structured? What tasks are assigned to the IT department?

Security

How secure is your organization's technology? Is your organization secure enough to meet HIPAA requirements?

Servers

Are servers up to date? Are the servers supporting the current and future needs of your organization?

Networking

Can your network support the workload for today and tomorrow? When was the last time you looked at the structure of your network?

Disaster Recovery

Is there a substantive and realistic disaster recovery plan in place?

Storage

Is proper encryption in place? Do you retain PHI, HR, and financial information long enough to meet regulatory requirements?

Telecommunications

Are your phone plans cost effective? Do you know the benefits of converged telephony?

Endpoints

Are your desktops encrypted and updated? How is data-loss prevention addressed? Can employees have secure remote access?

Applications & Data

Are specialty applications, such as an EHR, running properly? Are they a good fit with your company's culture and workflows?

Support

Is your help desk responsive and courteous when assisting others? Do they offer after-hours support? Can they fix issues remotely?

Having the right technology in place

that is optimized for your organization can be game-changing — not only for your staff, but also for the people you serve.

Contact us today to evaluate your behavioral health or post-acute organization's current technology environment to see where your gaps and opportunities lie.
